When instructed to do so, please answer the following questions as best you can. Hand in this worksheet at the end of class. Don’t forget to put your name at the top!

1. Write a for loop that prints out each character of a string `s` on its own individual line.

2. Using the string `substring` method on a string `s`, what start and end parameters would you use to return the whole string `s` itself?

3. Write the method header for the `interleave` method that takes two `Strings` as parameters (call them `s1` and `s2`, say), and returns a `String`.

4. Fill in the body of the `interleave` method so that it interleaves the strings `s1` and `s2`, that is, it returns a string with the first character from `s1` then the second character from `s2`, the third character from `s1`, etc. You can assume the strings are of the same length if you wish, and start with a character from `s1`
