

# Other NP-Complete Problems

More terminology for Boolean expressions:

- A *literal* is a variable or the negation of a variable.
- A *clause* is a single literal or the disjunction (OR) of literals..
- A Boolean expression is in *conjunctive normal form* if it is a single clause or the conjunction (AND) of clauses. For example,  
 $(\sim x \vee \sim y \vee z) \wedge (x \vee \sim y \vee \sim z)$

CNF-SAT is the language of satisfiable conjunctive normal form expressions.

Theorem: CNF-SAT is NP-Complete.

Proof: We will show that SAT reduces (in polynomial time) to CNF-SAT. In other words we will start with a Boolean expression  $s$  and produce expression  $s'$  so that  $s$  is in SAT if and only if  $s'$  is in CNF-SAT.

If we had a truth table for  $s$  it would be easy to make  $s'$ . For example, suppose we know that the only times  $s$  is F is when  $x=T, y=T, z=F$  and when  $x=F, y=T, z=T$ . We can build clauses that negate these instances:

$$s' = (\sim x \vee \sim y \vee z) \wedge (x \vee \sim y \vee \sim z)$$

Unfortunately, building a truth table for  $s$  takes exponential time.

Rather than building a truth table, given  $s$  we will build a CNF expression  $s'$  that has additional variables (and so is not equivalent to  $s$ ) but is satisfiable if and only if  $s$  is satisfiable.

Step 1: Parse  $s$  into a parse tree.

For example, if  $s$  is  $\sim(x \vee \sim y) \vee \sim z$  the parse tree is

Step 2: Walk down the tree using DeMorgan's laws to push negations to variables.

becomes

Step 3. Start at the leaves and walk up, replacing each node with a CNF expression that is satisfiable if and only if the subtree rooted at the node is satisfiable.

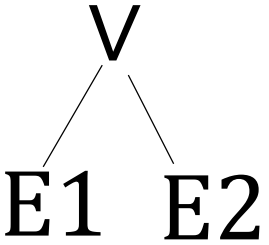

Case 3A: Suppose the tree is

and we have already replaced E1 with CNF expression F1 and E2 with F2. We replace the  $\wedge$ -node with  $F1 \wedge F2$ .

## Case 3B:

Suppose the tree is

```
graph TD; V --- E1; V --- E2;
```

and we have already replaced E1 with CNF expression

$F1 = g_1 \wedge g_2 \wedge g_3 \wedge \dots \wedge g_k$  (the  $g_i$  are the clauses of F1) and E2 with

$F2 = h_1 \wedge h_2 \wedge h_3 \wedge \dots \wedge h_l$ . Let  $y$  be a new variable not used in  $s$  or

any of the F-expressions. We replace the V-node with

$F = (y \vee g_1) \wedge (y \vee g_2) \wedge \dots \wedge (y \vee g_k) \wedge (\sim y \vee h_1) \wedge (\sim y \vee h_1) \wedge \dots \wedge (\sim y \vee h_l)$

If  $y=T$  this requires  $h_1 \wedge h_2 \wedge h_3 \wedge \dots \wedge h_l$  to be T, so F2 must be T.

Similarly, if  $y=F$  then F1 must be T. F is satisfiable if and only if

$F1 \vee F2$  is satisfiable.

By the time we get to the root of the tree this has produced a CNF expression  $s'$  that is satisfiable if and only if  $s$  is satisfiable. If the length of  $s$  is  $n$  then  $s'$  has no more than  $n$  clauses, each with length no more than  $n$ , so  $|s'| \leq n^2$ .

Example: In an earlier example we parsed  $s = \sim(x \vee \sim y) \vee \sim z$  as

and converted that to

The corresponding CNF expression is  $(w \vee \sim x) \wedge (w \vee y) \wedge (\sim w \vee \sim z)$

Example: Start with  $\sim(x \wedge (y \vee z)) \vee \sim x \vee (y \wedge \sim z)$ . This parses into

which  
converts to

Node A becomes  $(wV\sim x)\wedge(\sim wV\sim y)\wedge(\sim wV\sim z)$

B becomes  $(tV\sim x)\wedge(\sim tVy)\wedge(\sim tV\sim z)$

C becomes

$(uVwV\sim x)\wedge(uV\sim wV\sim y)\wedge(uV\sim wV\sim z)\wedge(\sim uVtV\sim x)\wedge(\sim uV\sim tVy)\wedge(\sim uV\sim tV\sim z)$

3CNF is the language of conjunctive normal form expressions where each clause has exactly 3 literals. For example, one expression in 3CNF is  $(x \vee \sim y \vee z) \wedge (x \vee y \vee \sim z)$

3CNF-SAT (also called 3SAT) is the language of satisfiable 3CNF expressions.

Theorem: 3CNF-SAT is NP-Complete

Proof: We will reduce CNF-SAT to 3CNF-SAT by converting CNF expressions to 3CNF expressions.

Let  $e = e_1 \wedge e_2 \wedge e_3 \wedge \dots \wedge e_k$  be an expression in CNF. Each  $e_i$  must be a disjunction of literals.

- a) Suppose  $e_i$  has only one literal,  $x$ . Let  $r$  and  $s$  be new variables. Replace  $e_i$  by  $f_i = (x \vee r \vee s) \wedge (x \vee \sim r \vee \sim s) \wedge (x \vee r \vee \sim s) \wedge (x \vee \sim r \vee s)$   
 $f_i$  can be satisfied if and only if  $x$  is satisfied.
- b) Suppose  $e_i$  has only two literals, such as  $x \vee y$ . Let  $r$  be a new variable and replace  $e_i$  by  $f_i = (x \vee y \vee r) \wedge (x \vee y \vee \sim r)$

c) Suppose  $e_i$  has 4 literals:  $e_i = x_1 \vee x_2 \vee x_3 \vee x_4$ . Let  $r$  be a new variable. Then  $f_i = (x_1 \vee x_2 \vee r) \wedge (x_3 \vee x_4 \vee \sim r)$

d) Suppose  $e_i$  has 5 literals:  $e_i = x_1 \vee x_2 \vee x_3 \vee x_4 \vee x_5$ . Let  $s_1$  and  $s_2$  be new variables. Then

$$f_i = (x_1 \vee x_2 \vee s_1) \wedge (x_3 \vee \sim s_1 \vee s_2) \wedge (x_4 \vee x_5 \vee \sim s_2)$$

$s_1$	$s_2$	$f_i$ reduces to
T	T	$x_5$
T	F	$x_3 \vee x_4$
F	T	$(x_1 \vee x_2) \wedge x_5$
F	F	$x_1 \vee x_2$

We can extend this pattern to any number of literals. If  $e_i$  has  $n$  literals then  $f_i$  has  $n-2$  clauses each with 3 literals and uses  $n-3$  new variables.  $|f_i| \leq 3 * |e_i|$  so the length of the 3CNF expression this builds is a polynomial function of the length of the original CNF expression.
