## HW 2

## Due in class Wednesday, February 15 <br> Again, you can do this one on paper if you do it neatly and legibly.

1. Here is an $\varepsilon$-NFA. Convert it to a DFA and find all of the strings of length 2 accepted by it.

2. Design an $\varepsilon$-NFA for the set of strings consisting of either 01 repeated 1 or more times or 010 repeated 1 or more times.
3. Give a regular expression for the set of strings over the alphabet $\{a, b, c\}$ containing at least one $a$ and at least one b.
4. Give a DFA for the set of strings with an even number of zeros.
5. Give a regular expression for the set of strings with an even number of zeros.
6. Describe in English the language denoted by the regular expression $(1+\varepsilon)\left(00^{*} 1\right)^{*} 0^{*}$
7. Suppose we have a finite automaton with no transitions into the start state and none out of the final state. This automaton accepts language $\mathcal{L}$. If we modify the automaton by adding an $\varepsilon$ transition from the final state to the start state, what language will it accept?
8. Convert the regular expression $(0+1)(01)^{*}$ into an $\varepsilon$-NFA.
9. Convert $(1+\varepsilon)\left(00^{*} 1\right)^{*} 0^{*}$ into an $\varepsilon$-NFA
10. Convert the following DFA into a regular expression.
